

One Script, Three Ways

The same seventeen beats, rewritten by each of the three moves.

Iteration 1 beat

Use case swap 6 beats

Angle swap 8 beats

Beat by beat, all three 17 beats

"same" means copy and paste from the control, word for word. Count the coloured cells down each column and you have the name of the test.

Beat	Control the surgery countdown	Iteration the sock hook	Use case swap the cortisone ladder	Angle swap the question nobody asked
1 Hook	The 14 month wait for my hip replacement turned out to be the best thing that ever happened to me.	I sat on the edge of my bed for eleven minutes one morning, holding a sock. Sixty four years old, and I could not reach my own foot.	My surgeon told me I had two injections left in that hip. After that, we talk about replacing it.	Eighteen months. Four appointments. And not one of them asked me when my periods stopped.
2 Credential	My name is Maggie. I'm 64.	same	same	same
3 Personal Crisis	I went to step off the kerb outside my house and my hip just gave out. The pain jumped from 0 to 9 in a second.	same	same	same
4 Pattern	I could no longer put my own socks on without wanting to scream. Sixty four years old and beaten by a sock.	same	same	same
6 Failed Attempts, the verdict	"It's bone on bone. We'll want to replace that." And just like that, I was on a waiting list. Fourteen months.	same	He sent me for a cortisone injection. The first one gave me four good months. The second gave me seven weeks. When I asked about a third, he told me there's a limit.	Same, then: Four appointments in eighteen months. Every one of them looked at the scan. Not one of them asked me a single question about anything else.
6 Failed Attempts, the 2am search	Typing "bone on bone alternatives"	same	Typing "how many cortisone injections can you have in one hip"	Typing "why does everything hurt after menopause"
7 Low Point, at home	John started doing the grocery runs without telling me. I noticed. I didn't say anything. But it broke something in me.	same	same	same
7 Low Point, the situation	I cried in the driveway. Not because of the surgery exactly. Because of the date.	same	I sat in the car park and cried. Not about the pain. I was counting. Two left.	same

Beat	Control the surgery countdown	Iteration the sock hook	Use case swap the cortisone ladder	Angle swap the question nobody asked
8 Bridge	"Maggie, has anyone actually told you what's gone wrong in there, or did they just point at the bone?"	same	same	"Maggie, in eighteen months, has a single one of them asked you anything that wasn't about the scan?"
10 Mechanism	Those tendons lose their blood supply and their ability to repair themselves. They get inflamed, then stuck in a loop where they stop healing.	same	same	"When did your periods stop?" Oestrogen is a big part of what keeps those tendons supplied with blood. When it drops away, that supply drops with it.
12 Differentiation	Not numbing. Not masking. Not loading it. Something that would drive warmth and blood into that exact spot.	same	same	Something that would put back what my body stopped delivering to that spot on its own.
13 Product	A therapy belt that does four things at once. Red and near infrared light, gentle heat, vibration, light compression.	same	same	same
18 Guarantee	I only bought it because it came with a 30 day money back promise, so I figured I could send it back and feel smug about it.	same	same	same
14 Results	I slept four hours on my right side. The side I had not slept on in over a year.	same	same	same
14 Resolution	By the time the hospital rang to confirm my surgery date, I realised I genuinely didn't want it anymore.	same	The clinic rang about booking number three. I told them I did not need it.	same
17 CTA	So if you're lying awake right now, dreading a date on a calendar...	same	So if you're lying awake right now, counting how many injections you have left...	So if nobody has asked you a single thing that wasn't about the scan...
19 Echo Close	I wish someone had told me eighteen months ago. So now I'm telling you.	same	I still have those two injections. I'm never going to use them.	Nobody asked me the question. So I'm asking you. When did yours stop?

The count

	Iteration	Use case swap	Angle swap
Beats changed	1	6	8
Beats copied	16	11	9
Beat 10, the mechanism	untouched	untouched	rewritten
Named	ITE	NN	NN

Beat 10 is the only honest test. The iteration and the use case swap leave the mechanism completely alone. The angle swap rewrites it. If you set out to change the angle and beat 10 still reads the same, you did not change the angle.

Sixteen of seventeen beats are copy and paste in an iteration.

Nine of seventeen even in the biggest move. Most of a working ad never changes, and that is the point.
